

# Patent Priority List - Scoresheet

High 20 Dat : **February 2000**

IL #: <b>10507</b>	Directorate: <b>PAT</b>	Inv ntors: Eric C. Honea, Raymond J. Beach
Title: Optical Coatings for Parasitic Suppression with Near Unity Low Angle Reflectivity		Non-LLNL
Inventors:		

**(Check all that apply)**

**High 20 Priority:**

**Recommended for the Top 20**

**Important technical invention**

**Commercial value**

**Significant Programmatic interest** (e.g. Aerogels)

**Important LLNL portfolio**

**Proof of concept exists**

**CRADA BIP**

**CRADA Subject Invention**

**License executed**

**License in negotiation**

**Commercial interactions/marketing**

**Other time factors** (bar date, provisional)

**Selected by IPAC for Top 20 (weis/Dunipace)**

**Added to Top 20 List**

**Bar Date:**  **Provisional filing date:**

**Publication Date:**

**Search Completed**  **Portfolio**

**Business Specialist:**  **Bill Grant**

**Additional comments (Specialist/Program Rep)**

This invention has the potential to radically optimize the engineering details for constructing solid state lasers that have strong commercial, industrial, and government appeal. Specifically, by using transparent optical coatings of controlled index, they have demonstrated a laser gain element with total-internal reflection used to confine pump light while suppressing parasitic oscillations, which would otherwise deplete the stored energy. What's impressive about this disclosure is that they present a "total" system solution, whereas, other researchers over the last two decades have put together bits and pieces of solutions for the problems in this generic technical area, the LLNL researchers have delivered a comprehensive system answer. **Ralph:** The first IL gives a description of a generic compact ion accelerator that, because of its compactness and potential for relative cost savings over prior embodiments, may be effectively applied to the treatment and eradication of cancers. The second IL is an improvement over the first one in that it guides the laser beam to the precise point of application, a few millimeters away from the target site, to generate the requisite proton beam. In this way the direct irradiation of a targeted area, *in situ* for medical use, also reduces the required proton energy to the order of 1 MeV. This energy is in contrast to energies of 100-200 MeV, in the earlier embodiment, that are necessary to travel the 10-20 cm distances for the method of treatment that begins external to the patient. Thus, in the second IL, the ion source and laser beam are unified into a single integrated unit.

PAT (Lasers)	Program Ralph Jacobs 10507 Patents John Wooldridge	1 Revisits May99 June99	<p>•5/6/99: RJ-Haven't had a chance to talk to Ray Beach. This is a Top 20. Feel there's some difference from the prior case. Has two unique engineering features not previously done.</p> <p>•6/3/99: Priority 1.</p>	•5/6/99: JW-Talk to Ray Beach.
Month 5/1/99	IP&C Bert Weis Amal Moulik		<p>JW-Would like to talk to the inventors. There is some art. A case I wrote a while back is pretty close on point.</p> <p>•6/3/99: JW-New in the sense there is a diffusing coating on the outside of the surface. Patentable, but we may encounter obviousness issues. If it gets specific enough, we can patent it. Honeau thinks its new, but it will be a hard fight.</p> <p>RJ-Top 20 material. A practical system because it's geometrically specific.</p> <p>CT-Think there are a lot of cases that are more important.</p>	•6/3/99: Priority 1.
